Using CSS to make the Markdown to HTML output mimics the Markdown to \LaTeX output.	
See demo in https://ickc.github.io/markdown-latex-css/ .	

1 CSS

1.1 Custom CSS

The followings are put in `_sass/`:

1. `amsthm`: See `ickc/pandoc-amsthm`
2. `list`: Replicated the different type of styles in different levels of a *nested list* in \LaTeX .¹
3. `heading` and `toc`:
 1. Heading counter: Replicate the numbering in headings.
 2. ToC counter. Similar to heading counter, it adds the numbering to the TOC.

¹`_list.scss` supports different styles in different levels (up to 6 levels) of a nested list.

1. ordered list:
 - In ordered list, up to level 4, the `_list.scss` provides the same styling as the \LaTeX output. 2 more styling is given in level 5 & 6, but are unrelated to \LaTeX 's styling.
 - \LaTeX will have error and complain the nesting is too deep beyond level 4. Something need to be done on the \LaTeX 's side (*e.g.* you repeat the nesting, *i.e.* level 5 use the numbering in level 1, etc.) *or* you can make the level 5 as an unordered list to get around the issue.
- unordered list:
 - It is not replicating the \LaTeX result because those bullets are not available in CSS.
 - It repeat the use of 3 styles twice to achieve a total level of 6.

4. **table**: Adapted from MultiMarkdown Composer 3 with slight modification.
5. **system-fonts**: a tiny font css setting the main font as “Gill Sans” and code font as “Consolas”, with multiple fallback including Chinese fonts.
 1. **system-fonts-lmodern**: Expect “Latin Modern Roman” and “Latin Modern Mono” exists in system fonts. Otherwise, see [Fonts \(Latin Modern\)](#).
6. **mmdc**: make it looks closer to MultiMarkdown Composer 3’s output CSS with minor modification.

A combined css including the related one in the next section is in [css/](#).

1.2 Fonts (Latin Modern)

A **font.css** is given in [fonts/fonts.css](#) which loads web fonts rather than system fonts.

It loads the Latin Modern Roman as the main fonts and Latin Modern Mono as the code font. The font is chosen to make it looks as close to the L^AT_EX’s as possible. A couple of fallback fonts as well as some Chinese system fonts are added for compatibility.

They are not included in the combined css mentioned above, since it is huge. If you need to load it, load it after the combined css.

1.3 CSS From Marked 2

- [/css-marked2/](#) are extracted from [Marked2](#). The license of each individual CSS are in the files itself.
- [/css-marked2-preview/](#) contains previews of some of the css

2 JS

2.1 Setup Files

There’s 2 JS setup in [/js/](#) as well:

1. [MathJax](#):
 1. [setup-mathjax-cdn.html](#): setup MathJax
 1. Cancel extension
 2. equation numbering
 3. a semi-finished Physics extension I wrote
 4. siunitx
 2. [load-mathjax-cdn.html](#): load MathJax itself. It should be included after the [setup-mathjax-cdn](#).

2. [Highlight.js](#)
